# Introduction to Biological Big Data

Simon Andrews simon.andrews@babraham.ac.uk

Two Day Version - v2025-12

## Course Structure

#### Day 1

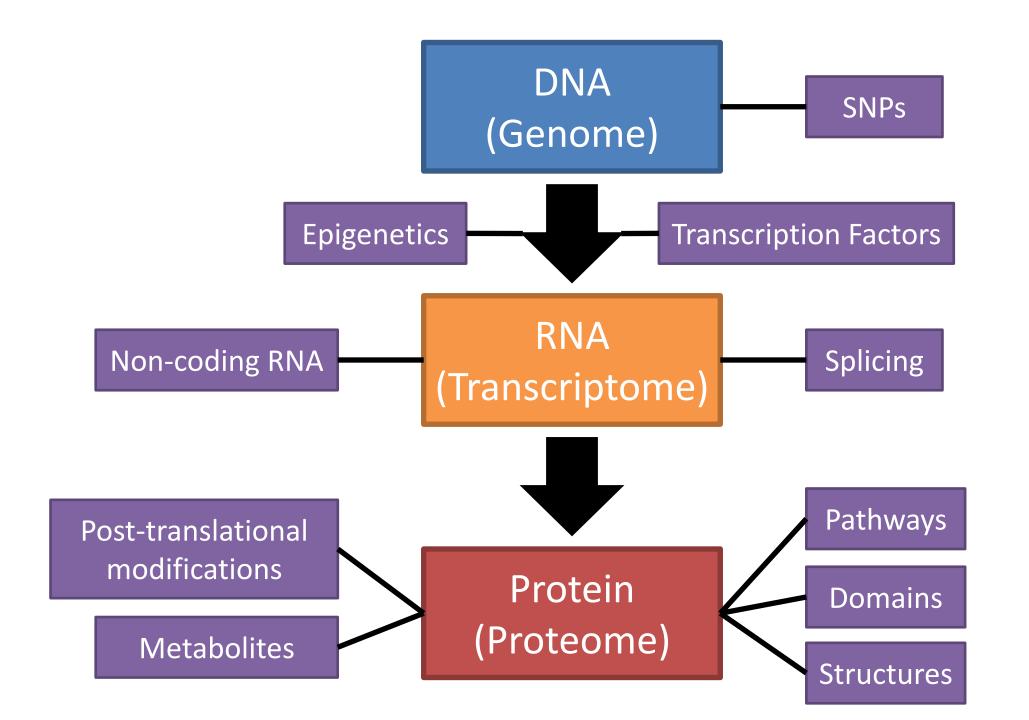

- Central Dogma Data Sources
  - Genomes and Annotations
  - Protein Domains and Structures
  - Reactions, Pathways and Interactions
- Experimental Techniques, Datatypes and Repositories
  - Sequencing and Variants
  - Proteomics and Metabolites
  - Flow and Imaging

### Day 2

- Practical Computation for Bioinformatics
  - Analysis approaches
  - Computing platforms for big data
  - Selecting bioinformatics software
  - Languages, Frameworks and pipelines

# Central Dogma Data Resources

### **Genomes and Annotations**

- Genome Assemblies
  - Underlying sequence of the organism's chromosomes
  - Often starts as scaffolds / contigs
  - Eventually assembled into chromosomes (still with holes)
    - Only one chromosome sequence per chromosome
  - Represents an 'average' individual (unless backcrossed)
  - Variations (natural or clinical) are stored separately)
  - Assembly is refined and improved over time, new releases get new names

# Genome Assembly Nomenclature

- Chromosome / Scaffold sequences
  - Originally deposited with ENA / NCBI as sequence records

- Genome Assembly
  - Given an official name by a supervising group (sometimes two!)
  - Fixed coordinates at that point

### Current Human Genome

Assembly Name: GRCh38

• Current Patch: GRCh38.p16

Managed by: Genome Reference Consortium

Assembly type: Chromosomal

• Chromosome:  $Chr1 = CM000663.2 = NC_000001.11$ 

Genome: GCF\_000001405.40 (Assembly Refseq)

GCA\_000001405.29 (Assembly Genbank)

### **Genome Annotation Sets**

- Built on top of a specific assembly
- Combination of prediction tools and real data
- Main annotation is Genes, Transcripts, Coding Sequences
- Many other tracks often added

- Different sites will have different annotations
- Annotations updated more frequently than assemblies

# **Genome Annotation Details**

#### ▼ Genome-Annotation-Data

##Genome-Annotation-Data-START##

Annotation Provider::NCBI

Annotation Status:: Updated annotation

Annotation Name::Homo sapiens Updated Annotation Release 109.20210226

Annotation Version::109.20210226

Annotation Pipeline::NCBI eukaryotic genome annotation pipeline

Annotation Software Version::8.6

Annotation Method::Best-placed RefSeq; propagated RefSeq model

Features Annotated::Gene; mRNA; CDS; ncRNA

##Genome-Annotation-Data-END##

#### **General stats**

- pseudogenes

Total No of Genes	60649	Total No of Transcripts	237012
Protein-coding genes	19955	Protein-coding transcripts	86757
Long non-coding RNA genes	17944	- full length protein-coding	61015
Small non-coding RNA genes	7567	- partial length protein-coding	25742
Pseudogenes	14773	Nonsense mediated decay transcripts	18881
- processed pseudogenes	10667	Long non-coding RNA loci transcripts	48752
- unprocessed pseudogenes	3565		
- unitary pseudogenes	241		
- polymorphic pseudogenes	49	Takal Na af dishipat kanadatiana	(20/0
- pseudogenes	15	Total No of distinct translations	63968
Immunoglobulin/T-cell receptor gene segments		Genes that have more than one distinct translations	13689
- protein coding segments	409		

236

Assembly	GRCh38.p14 (Genome Reference Consortium Human Build 38), INSDC Assembly GCA 000001405.29 &, Dec 2013
Base Pairs	3,099,750,718
Golden Path Length	3,099,750,718
Assembly provider	Genome Reference Consortium®
Annotation provider	Ensembl
Annotation method	Full genebuild
Genebuild started	Jan 2014
Genebuild released	Jul 2014
Genebuild last updated/ patched	Nov 2024
Database version	114.38
Gencode version	GENCODE 48

#### Gene counts (Primary assembly)

Coding genes	19,871 (excl 661 readthrough)
Non coding genes	42,126
Small non coding genes	4,866
Long non coding genes	35,044 (excl 301 readthrough)
Misc non coding genes	2,216
Pseudogenes	15,198 (excl 1 readthrough)
Gene transcripts	387,954

# Viewing Annotated Genomes

- Mostly web based
  - Species specific sites
  - Generic multi-species sites

- Often adds more information
  - Regulation, conservation, repeats
  - Experimental datasets
  - Upload your own

# Track Based Displays

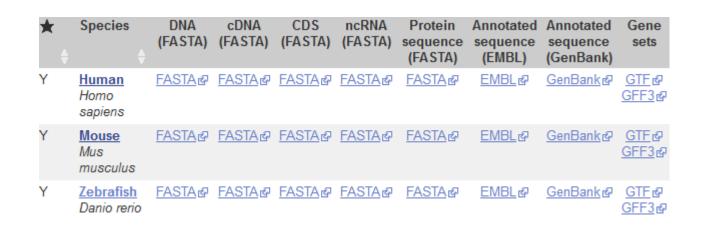

# Large Scale Queries

- Large scale querying and export of genomic data
- Annotations, Sequences, Variants etc.
  - Select data type (eg genes)
  - Select genome species
  - Select genes / regions / identifiers
  - Select attributes to export
  - Generate report

# Genome File Formats

- Genome Assemblies
  - Chr sequence, FastA format
  - A small header plus DNA bases
  - Also used for RNA / protein

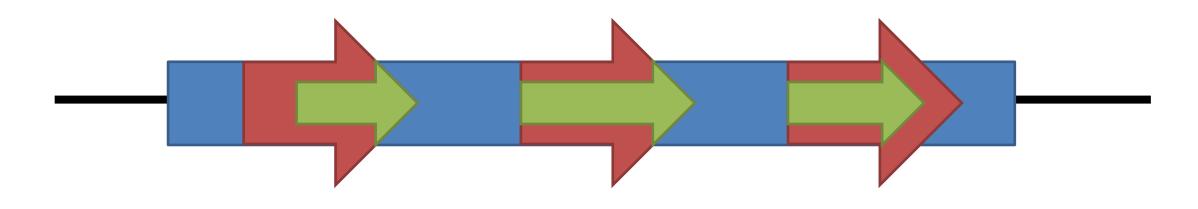

- Gene Annotations
  - GFF or GTF format (both very similar)
  - Hierarchical format linking exons to transcripts to genes

## FastA Format Data

```

### **Protein Domain Information**

- A single protein can have more than one functional unit
  - Proteins are annotated with functional 'domains'
  - A domain is normally linked with a globular folded structure
- Domain structures are re-used to provide modular functionality across multiple proteins.
  - Often linked to exon structures or splice variation
- It can be useful to know the key functional amino acids
  - Binding pockets
  - Active sites

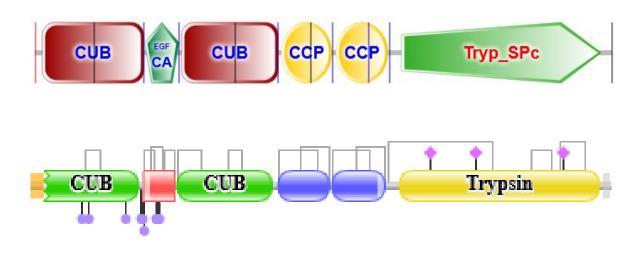

## Protein Domain Databases

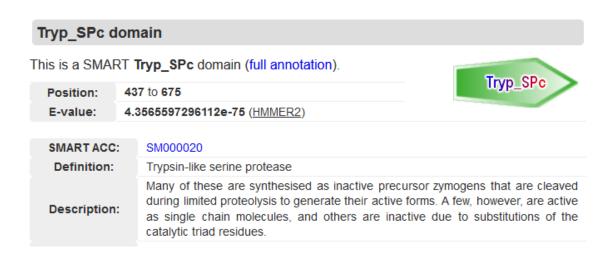

http://smart.embl-heidelberg.de/

https://www.ebi.ac.uk/interpro/

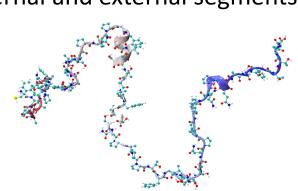

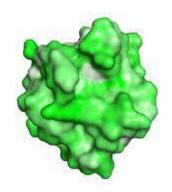

# Types of domain

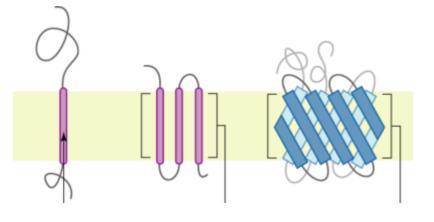

- Globular
  - Forms a concerted 3D structure
  - Most catalytic and some binding domains
- Semi-ordered
  - Coiled coil
  - Many binding domains

- Transmembrane
  - Threaded through a membrane
  - Transmembrane regions, then internal and external segments
- Disordered / Low Complexity
  - Linker regions
  - Intrinsically disordered proteins

#### Reactome

#### Summation

One hallmark of cancer is altered cellular metabolism. Malic enzymes (MEs) are a family of homotetrameric enzymes that catalyse the reversible oxidative decarboxylation of L-malate to pyruvate, with a simultaneous reduction of NAD(P)+ to NAD(P)H. As MEs generate NADPH and NADH, they may play roles in energy production and reductive biosynthesis. Humans possess three ME isoforms; ME1 is cytosolic and utilises NADP+, ME3 is mitochondrial and can utilise NADP+ and ME2 is mitochondrial and can utililse either NAD+ or NADP+ (Chang & Tong 2003, Murugan & Hung 2012).

NADP-dependent malic enzyme (ME1, aka c-NADP-ME) is a cytosolic enzyme that oxidatively decarboxylates (s)-malate (MAL) to pyruvate (PYR) and CO2 using NADP+ as cofactor (Zelewski & Swierczynski 1991). ME1 exists as a dimer of dimers (Murugan & Hung 2012, Hsieh et al. 2014) and a divalent metal such as Mg2+ is essential for catalysis (Chang & Tong 2003).

#### **KEGG**

CITRATE CYCLE (TCA CYCLE)

#### **Functional Gene Sets**

#### Molecular Function

describe activities that occur at the molecular level, such as "catalysis" or "transport". GO molecular function terms represent activities rather than the entities (molecules or complexes) that perform the actions, and do not specify where, when, or in what context the action takes place. Molecular functions generally correspond to activities that can be performed by individual gene products (i.e. a protein or RNA), but some activities are performed by molecular complexes composed of multiple gene products. Examples of broad functional terms are catalytic activity and transporter activity, examples of narrower functional terms are adenylate cyclase activity or Toll-like receptor binding. To avoid confusion between gene product names and their molecular functions, GO molecular functions are often appended with the word "activity" (a protein kinase would have the GO molecular function protein kinase activity).

Molecular-level activities performed by gene products. Molecular function terms

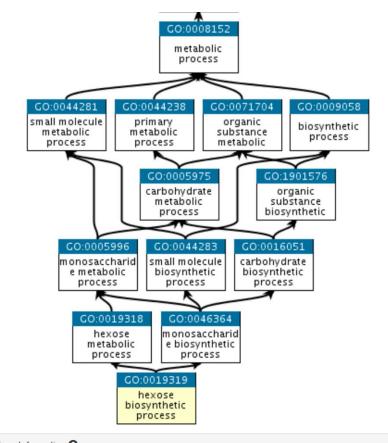

#### Cellular Component

The locations relative to cellular structures in which a gene product performs a function, either cellular compartments (e.g., mitochondrion), or stable macromolecular complexes of which they are parts (e.g., the ribosome). Unlike the other aspects of GO, cellular component classes refer not to processes but rather a cellular anatomy.

#### Biological Process

The larger processes, or 'biological programs' accomplished by multiple molecular activities. Examples of broad biological process terms are *DNA repair* or *signal transduction*. Examples of more specific terms are *pyrimidine nucleobase biosynthetic process* or *glucose transmembrane transport* 

. Note that a biological process is not equivalent to a pathway. At present, the GO does not try to represent the dynamics or dependencies that would be required to fully describe a pathway.

#### **Gene Interactions**

- Many genes form stable or transitory interactions with others
- Knowing the genes that interact helps understand biology

### Types of Interaction

- Physical
  - Two proteins directly interact, either stably or transiently

- Genetic
  - One gene influences another, normally after modification
    - Co-expression
    - Knockout compensation

### **Complex Prediction**

- Many proteins interact with several others, but at different times
- Complexes suggest that multiple proteins directly associate
  - Can't always be clearly predicted from pairwise interactions
  - Other experimental methods are required

### Regulatory Information Exercise

### Sequence Variants

### Sequence Variants

Reference Variant GATCTTACCTGA
GATCTTACCTGA

- Germline variants
  - Happen in sperm or eggs
  - Completely inherited into the next generation
  - Can cause genetic disease
- Somatic variants
  - Happen in other tissues
  - Partially penetrant
  - Common cause of cancer

### Types of Variant

Ref GATCTTA**G**CTGA **Substitution Single Nucleotide Polymorphism** Var GATCTTA**C**CTGA **SNP** Ref GATCTTAG...CTGA Insertion GATCTTA**CAA**CTGA Var InDel Ref GATCTTA**GCT**GA Deletio GATCTTAC. GA Var

#### Functional Variant Consequences

- Within Coding Region
  - Silent (codon changes, but same translation)
  - Missense (change translation from one amino acid to another)
  - Nonsense (change translation from one amino acid to STOP)
  - Frameshift (InDel changing the translation frame)

- Outside CDS
  - Breaks or adds splice junction
  - Changes functional binding site

#### Structural variants

- Chromosomal copy number change
  - Gain or loss of a chromosome
  - Leads to serious genetic disease

- Segmental Deletion / Duplication
  - Large parts of chromosomes deleted, duplicated, inverted, translocated
  - 1kb to 3Mbp
  - Affects many genes, can lead to gene fusions

#### **Databases of Variants**

- Common genomic variants
  - Measured across a large population
  - Shows natural variation
  - Not necessarily linked to disease
  - Used for studying populations and families

- Functional variants
  - Variants with an associated phenotype
  - Often disease related but can be any measurable phenotype

#### Variant Databases

- Single Variants
  - dbSNP (https://www.ncbi.nlm.nih.gov/snp/)
    - Full reference for any reported SNPs, mix of functional and non-functional
  - HGMD (<a href="http://www.hgmd.cf.ac.uk">http://www.hgmd.cf.ac.uk</a>)
    - Human genetic disease focussed database
  - COSMIC (https://cancer.sanger.ac.uk/cosmic)
    - Mutations observed in Cancer
    - Also has details of mutations in immortalised cell lines
- Larger Regions
  - dbVar (<u>https://www.ncbi.nlm.nih.gov/dbvar/</u>)
    - Counterpart to dbSNP for larger variants
  - ClinVar (<a href="https://www.ncbi.nlm.nih.gov/clinvar/">https://www.ncbi.nlm.nih.gov/clinvar/</a>)
    - Larger variants with clinical relevance
  - OMIM (<a href="https://www.ncbi.nlm.nih.gov/omim">https://www.ncbi.nlm.nih.gov/omim</a>)
    - A more wide ranging collection of the phenotypic variation linked to genes

### Variant Terminology

- Minor Allele Frequency (MAF)
  - How prevalent the variant is in the population

- Impact scores (SIFT / PolyPhen etc)
  - A quantitative value assessing the likely biological impact of a variant

#### Variant Exercise

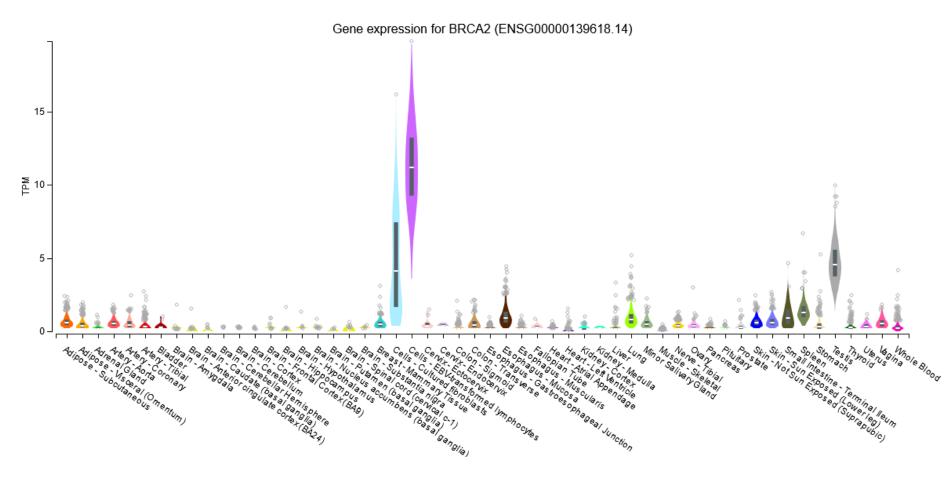

#### Other Information and Data Sources

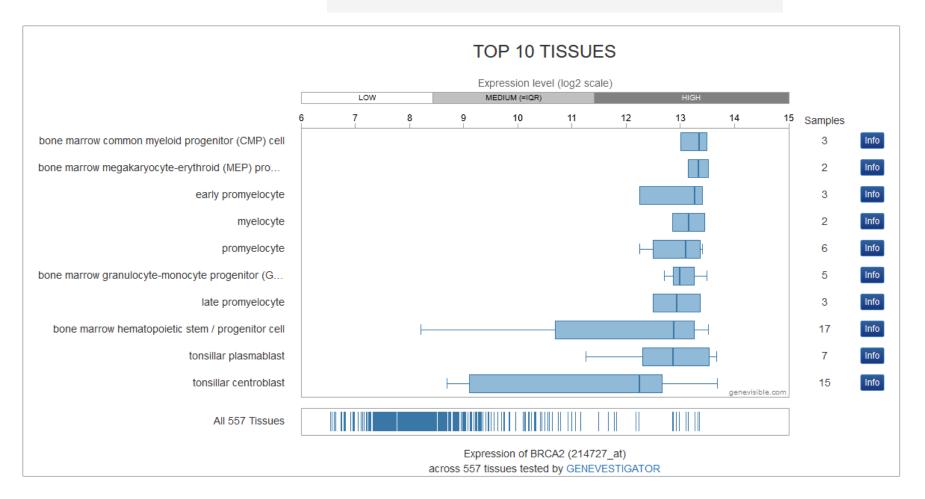

### Gene Expression Information

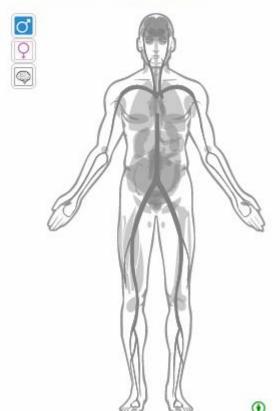

### Gene Expression Information

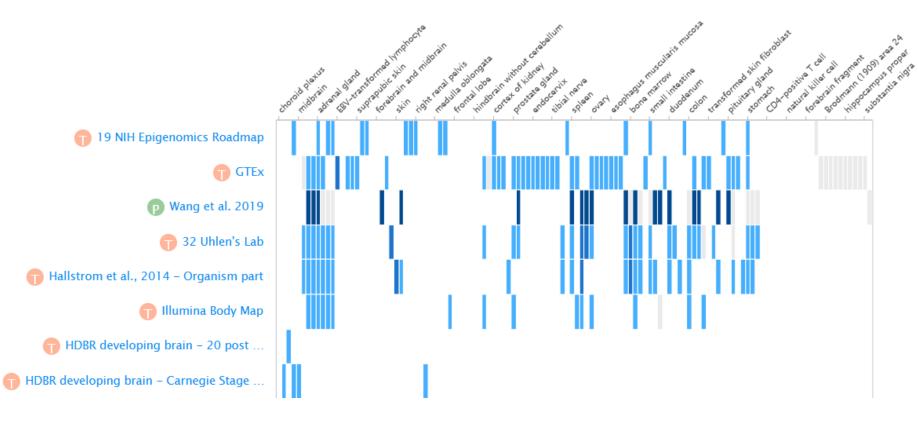

### Gene Expression Information

## Organism part Showing 29 experiments:

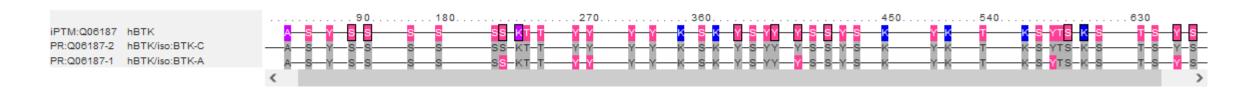

#### Post translational Modifications

- Many proteins are modified after they have been translated
  - Phosphorylation
  - Glycosylation
  - Ubiquitination
  - Nitrosylation
  - Methylation
  - Acetylation
  - Lipidation
  - Proteolysis

Both PTMs observed on a protein and proteins modified by a query gene.

#### Big Data Generation

- High throughput sequencing
  - Genomics, Transcriptomics, Epigenetics
- Multi-channel Flow Cytometry
  - Cell surface proteomics
- Mass Spectrometry
  - Proteomics, Metabolomics
- Biological Imaging
  - Cell / Tissue structure, Proteomics, Metabolomics

#### Data Repositories

 For many techniques deposition of data in a suitable repository is a condition of publication

 Repositories are more developed and complete for some techniques than others

Still a growing area

Mandatory deposition	Suitable repositories
Protein sequences	Uniprot
DNA and RNA sequences	Genbank
	DNA DataBank of Japan (DDBJ)
	EMBL Nucleotide Sequence Database (ENA)
DNA and RNA sequencing data	NCBI Trace Archive
	NCBI Sequence Read Archive (SRA)
Genetic polymorphisms	dbSNP
	dbVar
	European Variation Archive (EVA)
Linked genotype and phenotype data	dbGAP
	The European Genome-phenome Archive (EGA)
Macromolecular structure	Worldwide Protein Data Bank (wwPDB)
	Biological Magnetic Resonance Data Bank (BMRB)
	Electron Microscopy Data Bank (EMDB)
Gene expression data (must be MIAME compliant)	Gene Expression Omnibus (GEO)
	ArrayExpress
Crystallographic data for small molecules	Cambridge Structural Database
Proteomics data	PRIDE
*Earth, space & environmental sciences	Recommended Repositories

### FAIR Data Principles

- Designed to make data as useful as possible to future researchers
  - **—**Findable
    - Unique accession code
    - Rich metadata
  - Accessible
    - Automated query and download API
  - teroperable
    - Use of open formats
    - Standard Ontologies for descriptions
  - -Reusable
    - Clear licensing
    - Annotated to common community standards

# High Throughput Sequencing

#### Project: PRJNA559191

Extrachromosomal circular DNA (eccDNA) facilitates adaptive evolution by allowing rapid and extensive gene copy number variation, and is implicated in the pathology of cancer and ageing. Here, we demonstrate that yeast aged under environmental copper accumulate high levels of eccDNA containing the copper resistance gene CUP1. Transcription of CUP1 causes CUP1 eccDNA accumulation, which occurs in the absence of phenotypic selection. We have developed a sensitive and quantitative eccDNA sequencing pipeline that reveals CUP1 eccDNA accumulation on copper exposure to be exquisitely site specific, with no other detectable changes across the eccDNA complement. eccDNA forms de novo from the CUP1 locus through processing of DNA double-strand breaks (DSBs) by Sae2 / Mre11 and Mus81, and genome-wide analyses show that other protein coding eccDNA species in aged yeast share a similar biogenesis pathway. Although abundant we find that CUP1 eccDNA does not replicate efficiently, and high copy numbers in aged cells arise through frequent formation events combined with asymmetric DNA segregation. The transcriptional stimulation of CUP1 eccDNA formation shows that age-linked genetic change varies with transcription pattern, resulting in gene copy number profiles tailored by environment. Overall design: Aged cell samples analysed in pairs of -/+ Cu, for both wt and various mutants. 3 replicates of the 3xCUP1 experiment

#### Flow Exercise

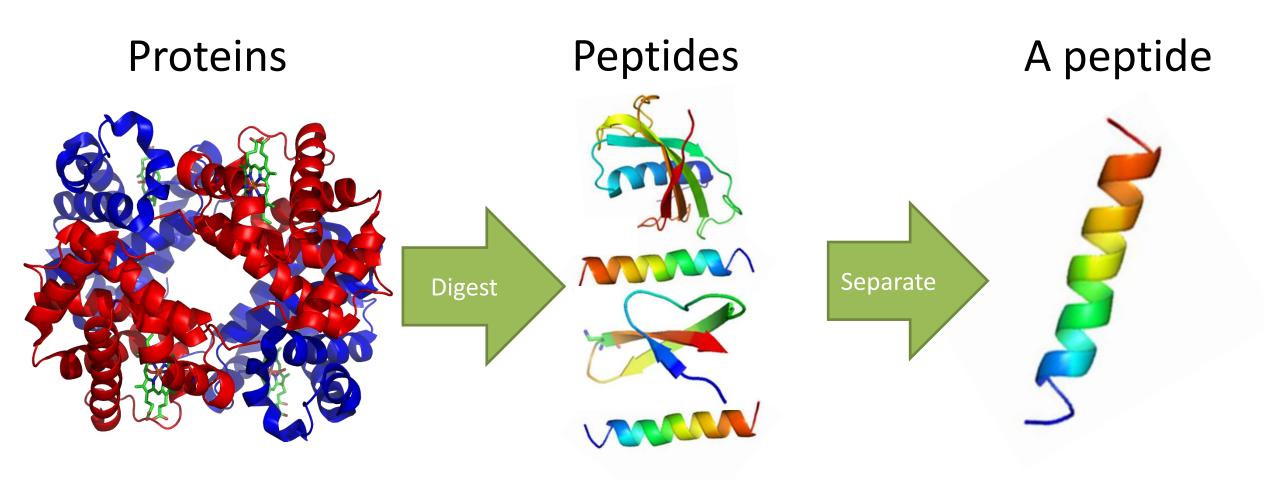

### Mass Spec

General purpose method to measure the accurate masses of small molecules

- Can be used to identify
  - Proteins (plus modifications)
  - Metabolites
    - Sugars
    - Nucleotides
    - Amino Acids
    - Lipids

### Protein Mass Spec

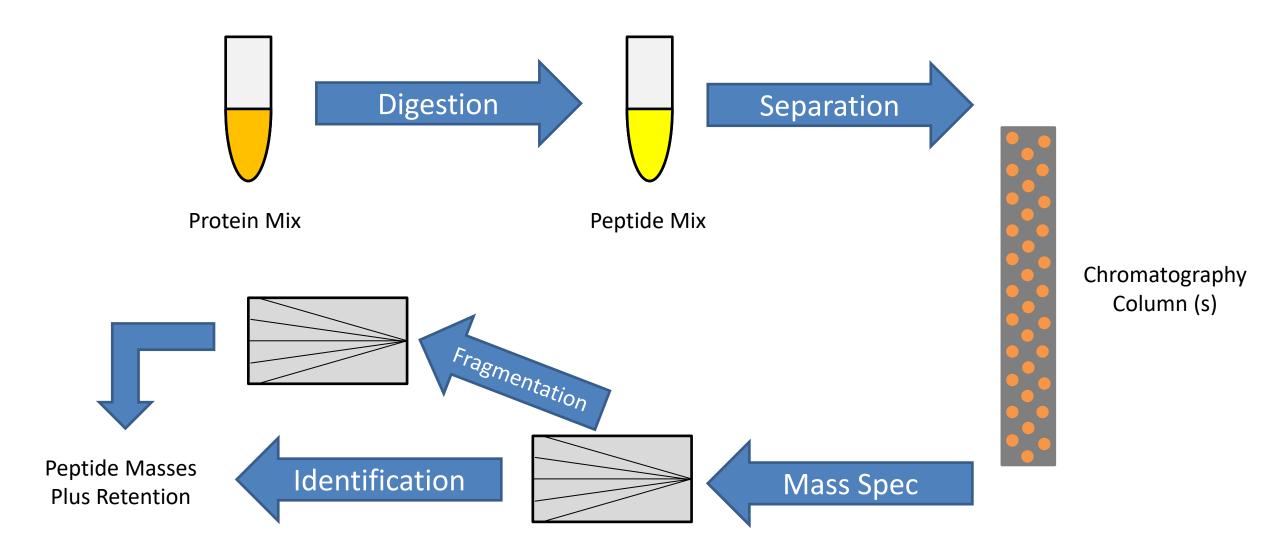

Too Big

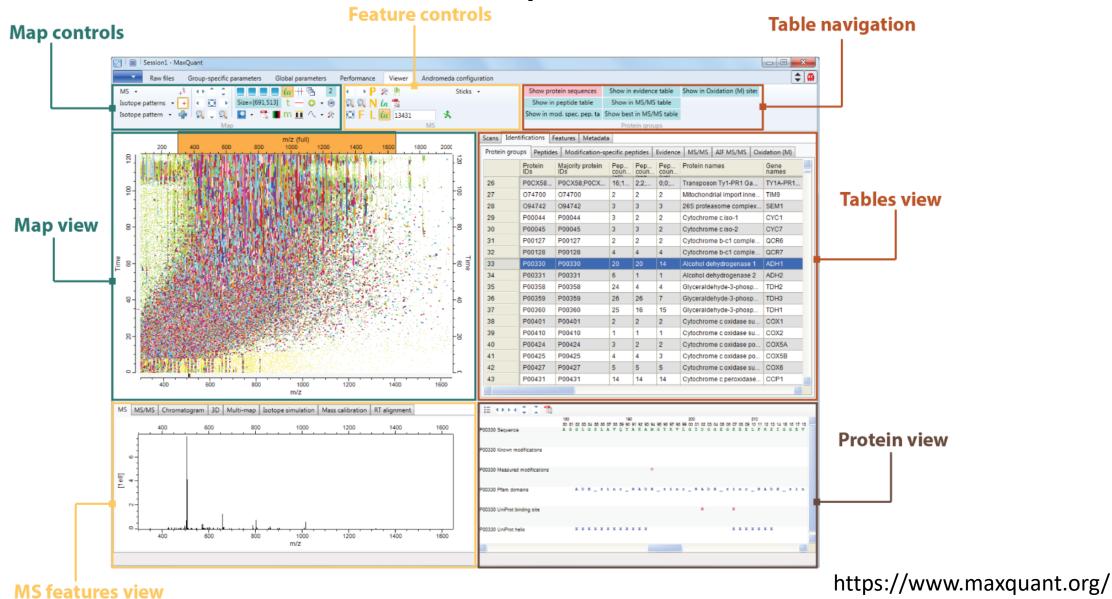

Too Many

Non-specific

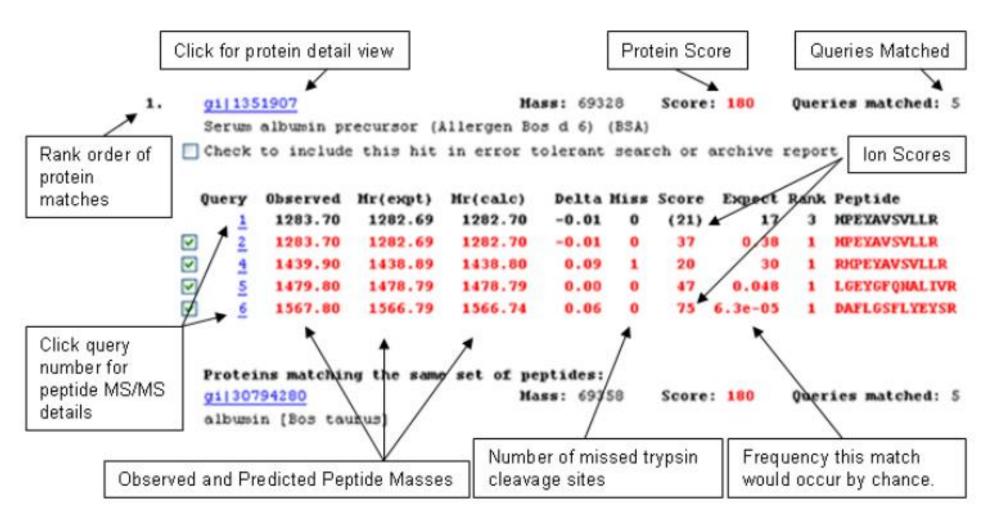

# Protein Mass Spec Workflow

### **Protein Mass Spec Results**

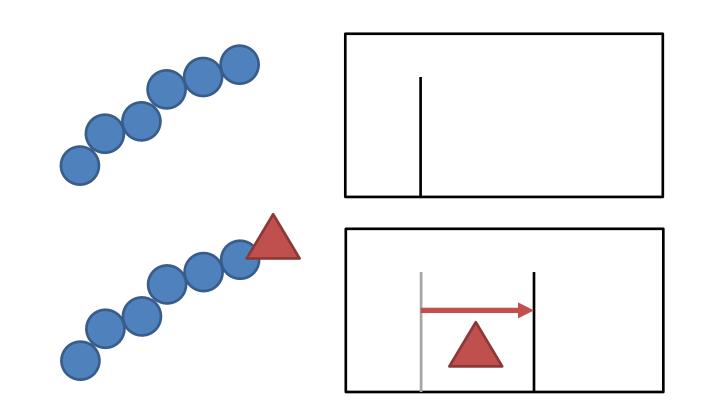

#### Protein Identification

#### Post Translational Modifications

 When doing tandem mass spectrometry you can also identify modified peptides

- Phosphorylation
- Acetylation
- Methylation
- Palmitylation
- Acylation
- Ubiquitination
- etc.

1,400 proteins measured from a single cell

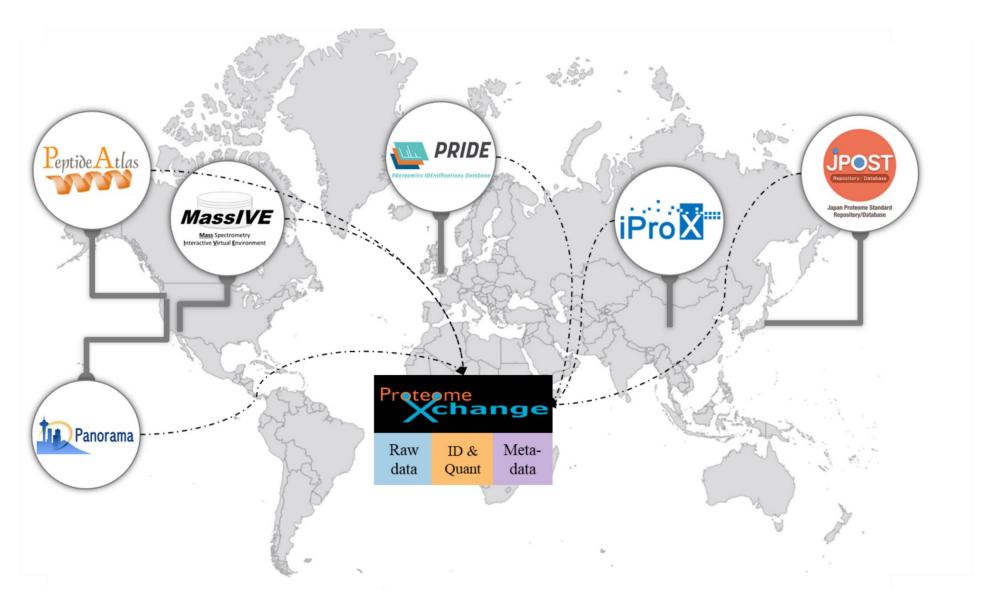

#### **Mass Spectral Imaging**

Fix a sample to a surface and then do scanning lonisation over it to get a spectrum for each point.

You can then pick any fragment and image its distribution over the original sample

# Data Repositories for Proteomics Mass Spec

### Data Repositories for Proteomics Mass Spec

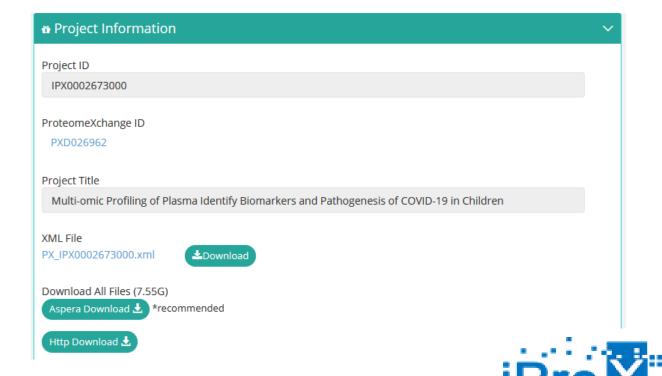

- Varying amounts of experimental annotation
- Good description of processing and preparation
- Raw data files available
  - Mass spec still uses a lot of proprietary vendor file formats
  - Open mzML format is defined but often not used
  - Converters exist but often lose information.

ataset Summary									
Title	Multi-omic Profiling of Plasma Identify Biomarkers and Pathogenesis of COVID-19 in Children								
Description	Although people of all ages are susceptible to COVID-19, children usually develop less severe disease than adu Little is known about the pathogenesis of COVID-19 in children. Herein, we conduct the plasma proteomic and metabolomic profiling of a cohort of COVID-19 children patients with mild symptoms, and uncovered that many proteins involved in immune response are significantly up-regulated in a stronger extent than in adults with COV Interestingly, more molecules involved in protective processes of reducing inflammation are also stimulated to antagonize the deleterious effect in both proteomic and metabolomic levels. By developing a machine learning-bipeline, we prioritize two set of biomarker combinations, and identify 5 proteins and 5 metabolites as potentially children-specific biomarkers. Further experiments demonstrate these protective metabolites not only inhibit the expression of pro-inflammatory factors, but also suppress the viral replication. Taken together, our study not only discover the protective mechanisms in children with COVID-19, but also shed light on potential therapies targets treating COVID-19.

### Mass Spec Data Exercise

# **Imaging Analysis**

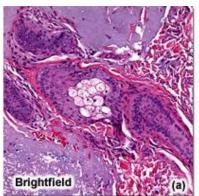

- What can you measure with imaging?
- Cell structure and morphology
  - In both live and fixed cells
- Targeted molecules (fluorescence microscopy)
  - Antibodies to proteins
  - Fluorescent fusion proteins
- Functional readouts
  - Redox state
  - -pH

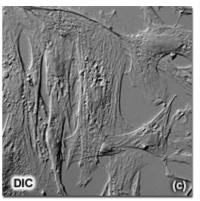

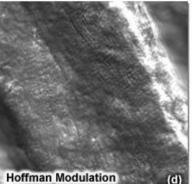

### Types of Microscopy

- Light Microscopy
  - Sample is illuminated, some light goes to the viewer
  - Biological samples are generally clear, so hard to see
  - Can use stains (often toxic) or reflection or phase shift to see better

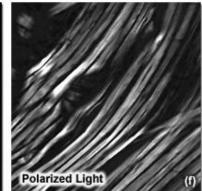

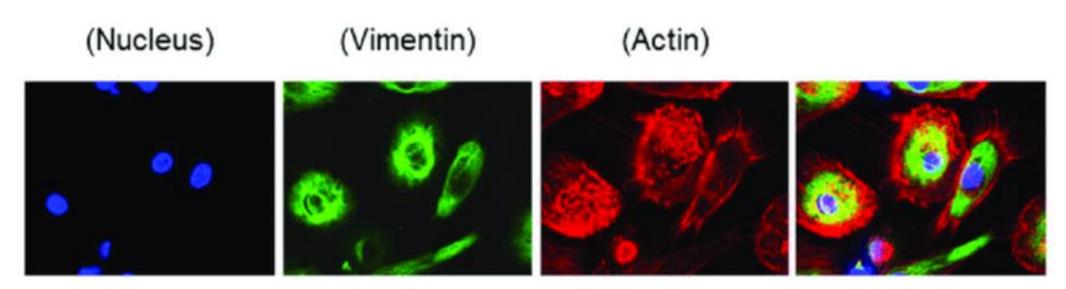

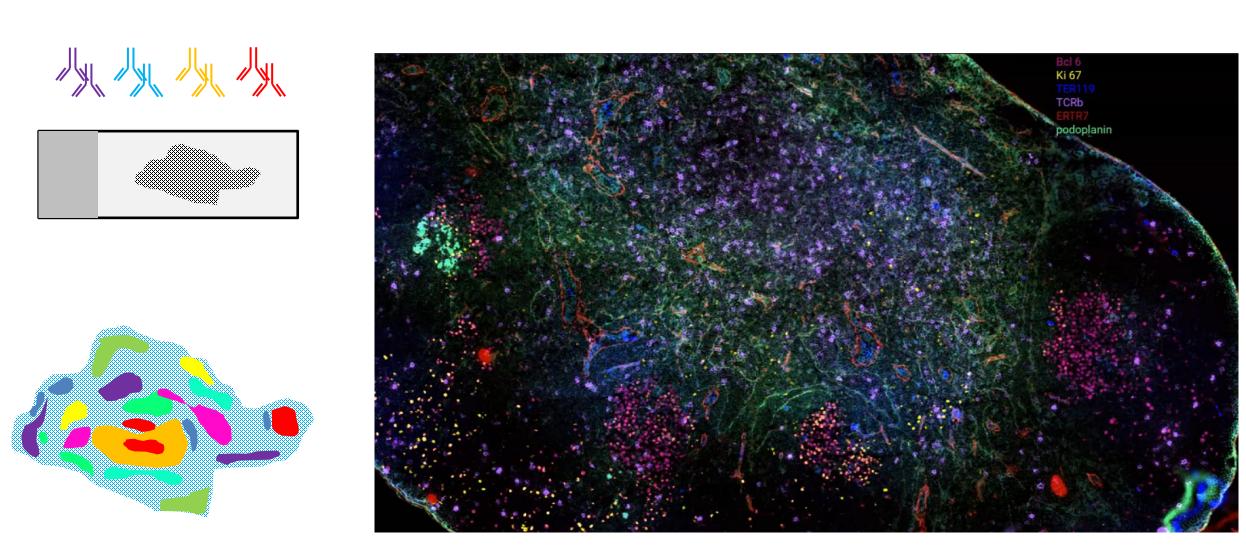

### Types of Microscopy

- Fluorescence Microscopy
  - Uses molecules which excite at one wavelength and emit at another
  - Allow the tagging of specific biological molecules
  - Confocal microscopes allow clear views of a single plane in the sample

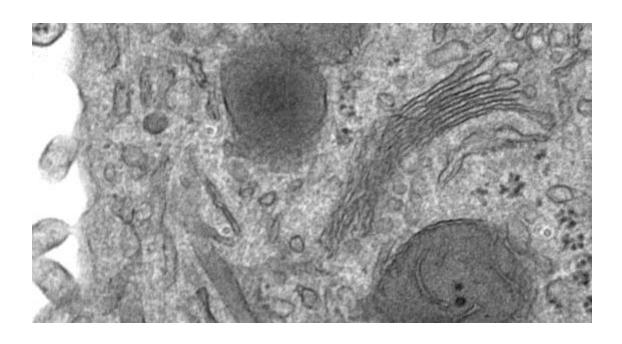

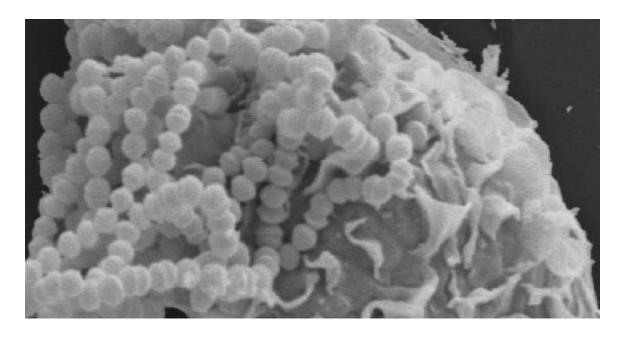

# Ultra-plex fluorescence imaging

### Types of Microscopy

- Electron Microscopy
  - Fixed and processed samples only (not live)
  - Very high resolution

### **High Content Imaging**

Microscopy traditionally operated on small numbers of individual samples

Improved equipment and automation now allows for more

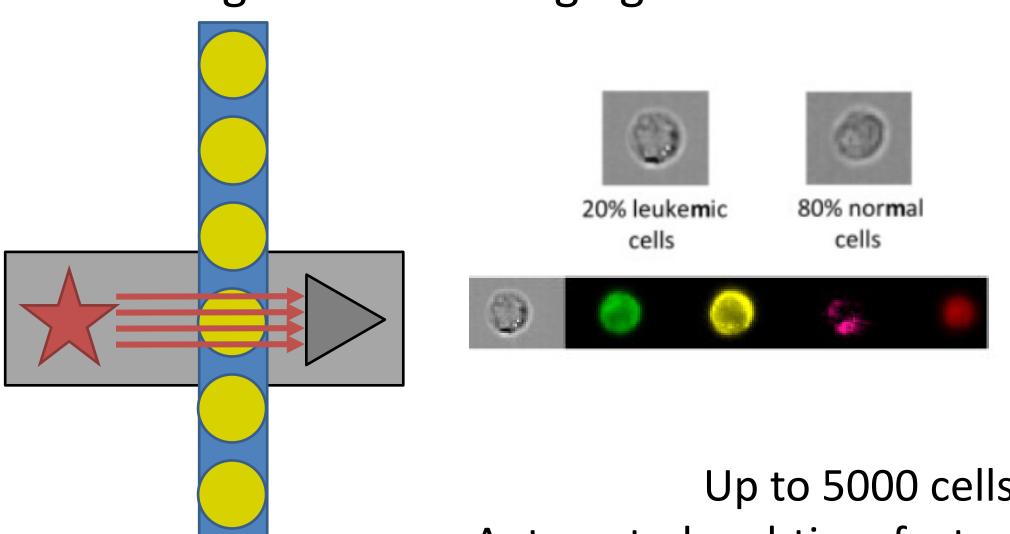

ambitious studies

- 384 well plates

- 30 images per well
- 5 different markers
- Thousands of images
- Hundreds of measured features per cell

# Imaging Flow Cytometry High Content Imaging from Flowed Cells

Up to 5000 cells per second Automated real-time feature extraction

### **High Content Applications**

- Screening for drugs with specific phenotypic effects
- Measuring CRISPR library phenotypes
- Measuring RNAi library phenotypes

### **Imaging Data Exercise**

# Computational Environments for Processing and Analysing Big Data

Simon Andrews

### Computation for Big Data

- Physical
  - What sort of machine / storage can I use?
  - What will I need?
- Software
  - What programs exist to process / analyse my data?
  - What operating system will they run under?
- Programming / Analysis
  - How can I write new analysis tools or perform programmatic analyses?

# **Topics for Today**

Running programs in a command line environment

How to select which programs / methods to use?

Programmatic analysis with R and Tidyverse

Developing new analysis tools with python

# Big Data Operating Systems

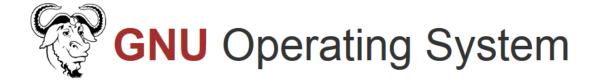

# What (exactly) is Linux?

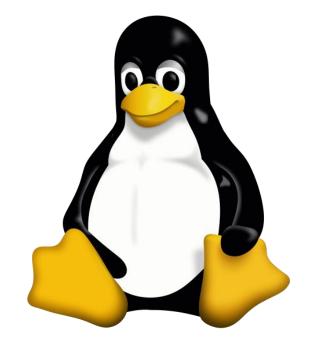

# Why Linux?

- Programs are long running and require automation
  - Need a command line driven operating system
  - Easy text based remote access

- Computers need to operate at scale
  - Free and open source are a real benefit
  - Can tinker with everything to tune performance

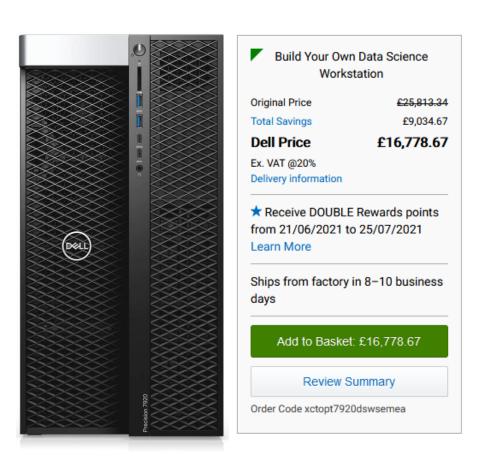

### Types of Linux installation

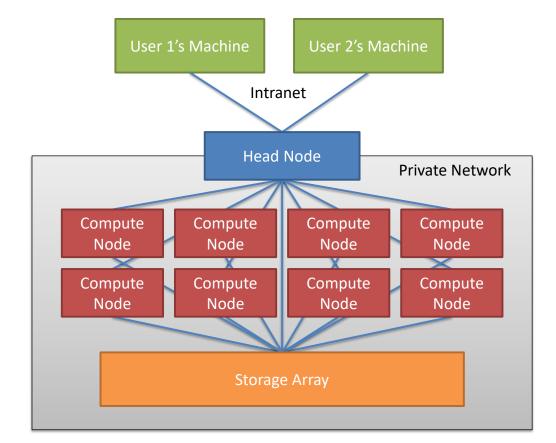

- Bare metal
  - Physical hardware
  - CD / DVD / USB / Network installation
  - Can be physically accessible (desktop) or remote (server / cluster)
- Virtual Machine
  - Runs within another operating system
  - Portable / disposable
  - Install from ISO / Network
- Cloud
  - Virtual machine on someone else's hardware
  - Amazon / Google are the main providers
  - Range of available hardware and OS images available
  - Pay by the hour

### Single Machines vs Clusters

1 physical box28 CPU cores512GB RAM

20 physical boxes ~700 CPU cores 7TB RAM

### Cluster Queues

fastqc data.fq.gz

ssub

-o f.log

--cores=2

--mem=5G

fastqc data.fq.gz

### Workflows

- Larger Scale Automation
- Multiple Programs
- Multiple Files
- Integrates with Clusters

# Running programs in the BASH shell

### Running programs in Linux

- Two major methods
  - Graphical
  - Command line
- Graphical launches only work for graphical programs accessed through a graphical environment
- Most data processing will be command line based, as will most remote access
  - Graphical programs can still be launched from the command line

### Shells

 A shell is a command line interpreter, used to launch software in Linux

Text commands are used to launch programs

We will use the most popular shell, BASH

### What does a shell provide

- Command line editing and construction tools
- History
- Job control

- Automation
  - Scripting language
  - Variables, functions etc

### Running programs

- Type the name of the program you want to run
  - Add on any options the program needs
  - Press return the program will run

When the program ends control will return to the shell

Run the next program!

### Running programs

```
student@ip1-2-3-4:~$ ls

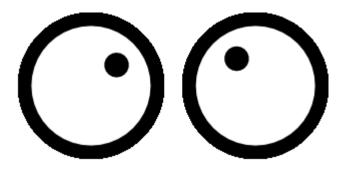

Desktop Documents Downloads examples.desktop Music
Pictures Public Templates Videos

student@ip1-2-3-4:~$
```

- Command prompt you can't enter a command unless you can see this
- The command we're going to run (ls in this case, to list files)
- The output of the command just text in this case

#### Running graphical programs

student@ip1-2-3-4:~\$ xeyes

student@ip1-2-3-4:~\$

Note that you can't enter another command until you close the program you launched

#### The structure of a unix command

Each option or section is separated by spaces. Options or files with spaces in must be put in quotes.

#### Command line switches

- Change the behaviour of the program
- Come in two flavours (each option usually has both types available)
  - Minus plus single letter (eg -x -c -z)
    - Can be combined (eg -xcz)
  - Two minuses plus a word (eg --extract --gzip)
    - Can't be combined
- Some take an additional value, this can be an additional option, or use an = to separate (it's up to the program)
  - --f somfile.txt (specify a filename)
  - --width=30 (specify a value)

#### Manual pages

 All core programs will have a manual page to document the options for the command

 Manual pages are accessible using the man program followed by the program name you want to look up.

All manual pages have a common structure

#### Manual Pages (man cat)

CAT (1)

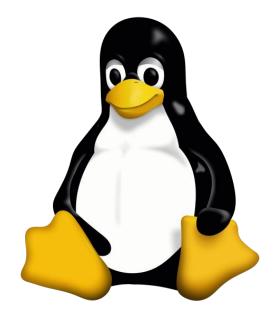

```
CAT (1)
                                                      User Commands
NAME
       cat - concatenate files and print on the standard output
SYNOPSIS
       cat [OPTION]... [FILE]...
DESCRIPTION
       Concatenate FILE(s) to standard output.
       With no FILE, or when FILE is -, read standard input.
       -A, --show-all
              equivalent to -vET
       -n, --number
              number all output lines
       -T, --show-tabs
              display TAB characters as ^I
       --help display this help and exit
EXAMPLES
       cat f - q
              Output f's contents, then standard input, then g's contents.
              Copy standard input to standard output.
       cat
```

#### Help Pages

- For non core programs (ie analysis / processing) you won't have a man page
- Instead use --help to get the help page

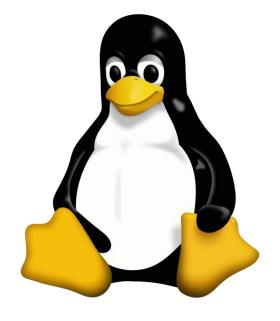

```
$ hisat2 --help
HISAT2 version 2.1.0 by Daehwan Kim (infphilo@gmail.com, www.ccb.jhu.edu/people/infphilo)
Usage:
 hisat2 [options] * -x <ht2-idx> {-1 <m1> -2 <m2> | -U <r> | --sra-acc <SRA accession number>} [-S <sam>]
 <ht2-idx> Index filename prefix (minus trailing .X.ht2).
            Files with #1 mates, paired with files in <m2>.
  < m1 >
            Could be gzip'ed (extension: .gz) or bzip2'ed (extension: .bz2).
  < m2 >
            Files with #2 mates, paired with files in <m1>.
            Could be gzip'ed (extension: .gz) or bzip2'ed (extension: .bz2).
            Files with unpaired reads.
  <r>
            Could be gzip'ed (extension: .gz) or bzip2'ed (extension: .bz2).
  <SRA accession number>
                             Comma-separated list of SRA accession numbers, e.g. --sra-acc SRR353653, SRR353654.
            File for SAM output (default: stdout)
  <sam>
 <m1>, <m2>, <r> can be comma-separated lists (no whitespace) and can be
 specified many times. E.g. '-U file1.fq, file2.fq -U file3.fq'.
Options (defaults in parentheses):
```

# Exercise 12 Running Programs in Bash

# **Understanding Unix File Systems**

### Unix File Systems

- Consists of a hierarchical set of directories (folders)
- Each directory can contain files

 No drive letters (drives can appear at arbitrary points in the file system)

No file extensions (you can add them, but they're not required)

### A simple unix filesystem

```
(Always the top of the file system)
home/ (Directory containing all home directories)
    anne/
    simon/
        Documents/ (All names are case sensitive)
          test.txt (A file we want to work with) /home/simon/Documents/test.txt
media/
    myusb/ (A USB stick added to the system)
```

#### Creating and moving into directories

- Every Unix session has a 'working directory' which is a folder where the shell looks for file paths
- You can see your current working directory with pwd
- Your initial working directory will be your home directory (/home/user)
- You can change your working directory with cd [new working directory]
- Running cd on its own takes you back home
- You can create a new directory with mkdir [new directory name]

# Specifying file paths

- Some shortcuts
  - ~ (tilde, just left of the return key) the current user's home directory

(single dot) - the current directory

 .. (double dot) - the directory immediately above the current directory

## Specifying file paths

- Absolute paths from the top of the file system
  - /home/simon/Documents/Course/some\_file.txt
- Relative paths from whichever directory you are currently in
  - If I'm working in /home/simon/Course/
  - big\_data.csv = /home/simon/Course/big\_data.csv
- Paths using the home shortcut
  - ~/Documents/Course/some\_file.txt will work for user simon anywhere on the system

### Command line completion

 Most errors in commands are typing errors in either program names or file paths

 Shells (ie BASH) can help with this by offering to complete path names for you

 Command line completion is achieved by typing a partial path and then pressing the TAB key (to the left of Q)

### Command line completion

Actual files in a folder:

Desktop

Documents

Downloads

examples.desktop

Music

Pictures

Public

Templates

Videos

If I type the following and press tab:

De [TAB] will complete to Desktop as it is the only option

T [TAB] will complete to Templates as it is the only option

Do [TAB] will no nothing (just beep) as it is ambiguous

Do [TAB] [TAB] will show Documents and Downloads since those are the only options

Do [TAB] [TAB] c [TAB] will complete to Documents

You should ALWAYS use TAB completion to fill in paths for locations which exist so you can't make typing mistakes

(it obviously won't work for output files though)

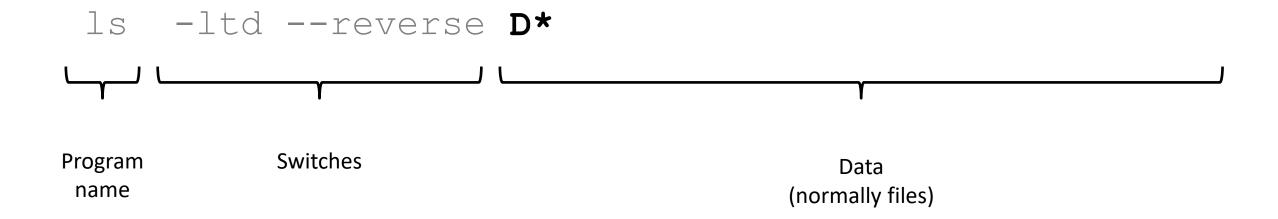

#### Wildcards

- Another function provided by your shell (not your application)
- A quick way to be able to specify multiple related file paths in a single operation
- There are two main wildcards
  - \* = Any number of any characters
  - ? = One of any character
- You can include them at any point in a file path and the shell will expand them before passing them on to the program
- Multiple wildcards can be in the same path.
- Command line completion won't work after the first wildcard

#### Wildcard examples

```
$ ls Monday/*txt
Monday/mon 1.txt Monday/mon 2.txt Monday/mon 3.txt
Monday/mon 500.txt
$ ls Monday/mon ?.txt
Monday/mon 1.txt Monday/mon 2.txt Monday/mon 3.txt
$ ls */*txt
Friday/fri 1.txt Monday/mon 1.txt Monday/mon 3.txt
Tuesday/tue 1.txt
Friday/fri 2.txt Monday/mon 2.txt Monday/mon 500.txt
Tuesday/tue 2.txt
$ ls */*1.txt
Friday/fri 1.txt Monday/mon 1.txt Tuesday/tue 1.txt
```

#### The structure of a Unix command

Each option or section is separated by spaces. Options or files with spaces in must be put in quotes.

## Manipulating files

You will spend a lot of time managing files on a Linux system.

- Viewing files (normally text files)
- Editing text files
- Moving or renaming files
- Copying files
- Deleting files
- Finding files

#### Viewing Files

- Simplest solution
  - cat [file] Sends the entire contents of a file (or multiple files) to the screen.
- Quick look
  - head or tail will look at the start/end of a file

• /[term] = search for [term] in the file

- head -10 [file]
- tail -20 [file]
- More scalable solution

• q

less is a 'pager' program, sends output to the screen one page at a time

```
    Return / j = move down one line
    k = move up one line
    Space = move down one page
    b = go back one page
```

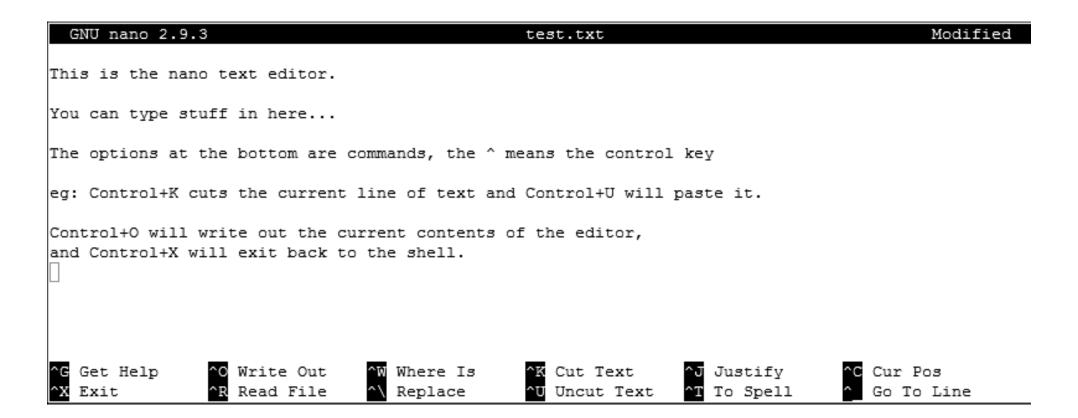

quit back to the command prompt

#### Editing files

- Lots of text editors exist, both graphical and command line
- Many have special functionality for specific content (C, HTML etc)
- nano is a simple command line editor which is always present

#### Using nano to edit text files

nano [filename] (edits if file exists, creates if it doesn't)

### Moving / Renaming files

- Uses the mv command for both (renaming is just moving from one name to another)
- mv [file or directory] [new name/location]
- If new name is a directory then the file is moved there with its existing name
- Moving a directory moves all of its contents as well
- Examples
  - mv old.txt new.txt
  - mv old.txt ../Saved/
  - mv old.txt ../Saved/new.txt
  - mv ../Saved/old.txt .

#### Copying files

- Uses the cp command
- cp [file] [new file]
- Operates on a single file
- Can copy directories using recursive copy (cp −r)

#### Examples

- cp old.txt new.txt
- cp old.txt ../Saved/
- cp old.txt ../Saved/new.txt
- cp ../Saved/old.txt .
- cp -r ../Saved ./NewDir
- cp -r ../Saved ./ExistingDir/ (only if ExistingDir exists)

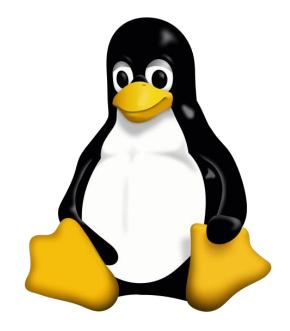

#### Deleting files

- Linux has no undo.
- Deleting files has no recycle bin.
- Linux will not ask you "are you sure"
- Files can be deleted with the rm command
- Directories (and all of their contents) can be deleted with rm -r

#### Examples

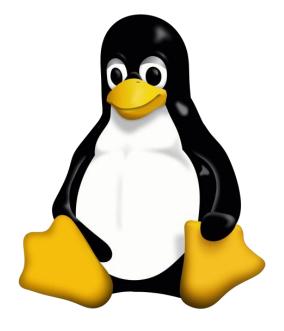

- rm test file.txt test file2.txt
- rm \*.txt (be VERY careful using wildcards. Always run ls first to see what will go)
- rm -r Old directory/

# Exercise 13: Using the filesystem

### More clever BASH usage

### What we know already

How to run programs

How to modify the options for a program using switches

How to supply data to programs using file paths and wildcards

#### What else can we do

- Record the output of programs
- Check for errors in programs which are running
- Link programs together into small pipelines
- Automate the running of programs over batches of files

All of these are possible with some simple BASH scripting

### Recording the output of programs

- One of the aspects of POSIX is a standard system for sending data to and from programs.
- Three data streams exist for all Linux programs (though they don't have to use them all)
  - STDIN (Standard Input a way to send data into the program)
  - STDOUT (Standard Output a way to send expected data out of the program)
  - STDERR (Standard Error a way to send errors or warnings out of the program)
- By default STDOUT and STDERR are connected to your shell, so when you see text coming from a program, it's coming from these streams.

### Recording the output of programs

 Rather than leaving these streams connected to the screen, you can link them to either files, or other programs to either create logs, or to build small pipelines

#### Redirecting standard streams

- You can redirect using arrows at the end of your command
  - > [file] Redirects STDOUT
  - < [file] Redirects STDIN</pre>
  - 2> [file] Redirects STDERR
  - -2>&1 Sends STDERR to STDOUT so you only have one output stream

```
$ find . -print > file_list.txt 2> errors.txt

$ 1s
Data Desktop Documents Downloads errors.txt examples.desktop file_list.txt Music Pictures Public Templates Videos

$ head file_list.txt
.
./Downloads
./Pictures
./Public
./Music
./.local
./.local
./.local/share/icc
./.local/share/icc
./.local/share/icc/edid-33d524c378824a7b78c6c679234da6b1.icc
```

## Throwing stuff away

- Sometimes you want to be able to hide output
  - STDOUT I just want to test whether something worked
  - STDERR I want to hide progress / error messages

- Linux defines a special file /dev/null which you can write to but just discards all data sent to it
  - -might fail > /dev/null
  - -chatty app 2> /dev/null

## Linking programs together with pipes

 Part of the original UNIX design was to have lots of small programs doing specific jobs, and then to link them together to perform more advanced tasks.

 Pipes are designed to do this by connecting STDOUT from one program to STDIN on another

### Linking programs together using pipes

- Pipes are a mechanism to connect the STDOUT of one program to the STDIN of another. You can use them to build small pipelines
- To create a pipe just use a pipe character | between programs

```
$ ls | head -2
Data
Desktop
```

#### Useful programs for pipes

Whilst you can theoretically use pipes to link any programs, there
are some which are particularly useful, these are things like:

- − wc to do word and line counting
- grep to do pattern searching
- sort to sort things
- uniq to deduplicate things
- less to read large amounts of output
- zcat/gunzip/gzip to do decompression or compression

# Small example pipeline

 Take a compressed fastq sequence file, extract from it all of the entries containing the telomere repeat sequence (TTAGGG) and count them

• zcat file.fq.gz | grep TTAGGGTTAGGG | wc -1

```
$ zcat file.fq.gz | wc -l
179536960

$ zcat file.fq.gz | grep TTAGGGTTAGGG | wc -l
3925
```

# Iterating over files

 When processing data it is common to need to re-run the same command multiple times for different input/output files.

 Some programs will support being provided with multiple input files, but many will not.

 You can use the automation features of the BASH shell to automate the running of these types of programs

### The BASH for loop

- Simple looping construct
  - Loop over a set of files
  - Loop over a set of values

 Creates a temporary environment variable which you can use when creating commands

#### Examples of for loops

```
for file in *txt
  do
    echo $file
    grep .sam $file | wc -l
    done
```

#### **Job Control**

- By default you run one job at a time in a shell
  - Shells support multiple running jobs

- States of job
  - Running foreground (shell has the attention of the job)
  - Running background (output goes to the shell but other jobs can run)
  - Suspended background (job exists but is paused, consumes no CPU)
  - Running disconnected (output is no longer attached to the shell)

#### **Job Control**

prog to run

(starts in foreground)

• prog to run &

(starts in background)

• nohup prog to run &

(disconnects, logs to nohup.out)

• nohup prog to run > log.txt &

#### Exercise 14: Automation in BASH

# **Selecting Analysis Tools**

### RNA-Seq Aligner Selection

- ABMapper
- BBMap

- Longevity and support

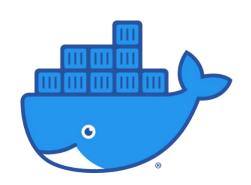

# **Installing New Software**

# **Different Options**

- Ask someone to do it for you
  - Best option if you're on a managed system
- Manual Installation
  - Look for install instructions sometimes trivial, sometimes horrific
- Containerised Applications
  - Docker or Singularity
- Automated Installation
  - BioConda

#### Containers

- Single applications or pipelines in a VM
- Lighter than normal virtual machines
- Every app operates in an isolated environment
- All dependencies handled for you
- Not easy to modify or debug
- Software black box

# BIOCONDA®

- Collection of recipes to install applications on different systems
- Handles dependencies and versioning
- Local installation per user
- Options to install mutually incompatible software
- Great when it works
  - Users love it
- A nightmare when it doesn't work
  - Debugging is really complex

1. Conda is open source and free for all users. The conda package manager and any other tools in the conda ecosystem (which you can find in these GitHub organizations: https://github.com/conda, https://github.com/conda-incubator) are and will continue to be fully open source and free to use for everyone. The full governance policy of the conda open-source software (OSS) project can be found here: https://github.com/conda/governance. These projects are not governed by Anaconda Inc.

\*One exception is that we do not allow the content of our servers to be mirrored on a university's servers without a license.

2. The Community Repository (https://anaconda.org) is free. This means you can install and update any packages hosted on any community channel, including conda-forge (https://anaconda.org/conda-forge). However, it's important to note that we offer convenience mirrors of some of our non-free channels on anaconda.org: main, r, msys2, and anaconda. The packages in those four specific channels are subject to our Terms of Service, even though they are mirrored at anaconda.org.

\* "Channels" are defined as remote package storage locations maintained by various entities, including the community, companies, or individuals

- 3. The Anaconda Repository (https://repo.anaconda.com/) is governed by our Terms of Service which means
  - It is free for individuals, universities, as well as companies with fewer than 200 employees; and
  - It requires a license for any use at companies with 200 or more employees that are not educational or academic instructional organizations (including, for example, non-university research entities and national laboratories).
- 4. The Miniconda Installer is free for everyone except to the extent guideline 3 (see above) applies, which means

22 🖵

#### Anaconda puts the squeeze on data scientists now deemed to be terms-of-service violators

Academic, non-profit organizations told to start paying up – or else

Thomas Claburn

Thu 8 Aug 2024 // 12:26 UTC

Miniconda installer is free

UPDATED Research and academic organizations are just now finding out that they will have to pay for software made by Anaconda, when for years these groups were under the impression it could be used at no cost.

That realization follows the data science biz broadening its pursuit of what it sees as violators of its shifting terms-of-service.

A source who works at a medium-size non-profit academic research institution told *The Register* about being on the end of a legal demand to purchase a commercial license for the Anaconda-built software they had been using for free.

"We wish to inform you that, should this situation persist ... our legal team may be compelled to consider measures aligned with our prevailing pricing and invoicing policies, which could include issuing back bills for any unauthorized or excess usage of Anaconda products," the note to the institution read.

Observing that the message came via a mailing list application, our source speculated Anaconda has sent out many such letters and suggested that the Texas-based developer, following the appointment of CEO Barry Libert in January 2024, has become quite interested in enforcing license compliance.

"This will be a huge issue for universities and the research community who were basically exempt until the new terms of service updated in March 2024," our source told us.

- BioConda is free
- CondaForge is freed

 The "defaults" channel is NOT free (and not needed)

conda config --remove channels defaults conda config --add channels conda-forge

# [Optional BioConda Exercise]

## **Programmatic Environments**

## Different Types of Programmatic Environment

#### **Data Analysis**

- Alternative to GUI exploration/analysis
- Interactive Environment
- Graphing and Statistics
- Report Generation
- Reproducible
- Automatable
- Flexible
- Often one-off

#### **Application Development**

- Data processing and extraction
- Automation and pipelining
- Use of remote resources
- Interaction with users
- Non-interactive use
- Advanced command line options
- Longer term development

## **Programmatic Analysis**

Alternative and complement to exploratory graphical tools

- Positives
  - Reproducible and automatable
  - Completely flexible and scalable

- Negatives
  - Tends to encourage repetition without exploration
  - Can be difficult to spot unusual behaviour / bugs

# R, Rstudio, Tidyverse, Notebooks

#### Notebook Structure

 Single overall text document, split into sections

stat_summary(geom="errorbar", width=0.3, size=1, fun.data=mean_se)
```

### Output

# Creating a Notebook in RStudio

 You may need to install some packages (Rstudio will prompt you if you do)

 Opens a default template which you can then edit

```
title: "R Notebook"
    output: html_notebook
 6 This is an [R Markdown] (http://rmarkdown.rstudio.com) Notebook. When
   you execute code within the notebook, the results appear beneath the
    code.
   Try executing this chunk by clicking the *Run* button within the
    chunk or by placing your cursor inside it and pressing
    *Ctrl+Shift+Enter*.
                                                                 ⊕ ≚ ▶
   plot(cars)
12 -
13
   Add a new chunk by clicking the *Insert Chunk* button on the toolbar
    or by pressing *Ctrl+Alt+I*.
   When you save the notebook, an HTML file containing the code and
    output will be saved alongside it (click the *Preview* button or
    press *Ctrl+Shift+K* to preview the HTML file).
   The preview shows you a rendered HTML copy of the contents of the
    editor. Consequently, unlike *Knit*, *Preview* does not run any R
    code chunks. Instead, the output of the chunk when it was last run
    in the editor is displayed.
19
```

#### Notebook sections

Header

Commentary

Code

This is an [R Markdown] (<a href="http://rmarkdown.rstudio.com">http://rmarkdown.rstudio.com</a>) Notebook. When you execute code within the notebook, the results appear beneath the code.

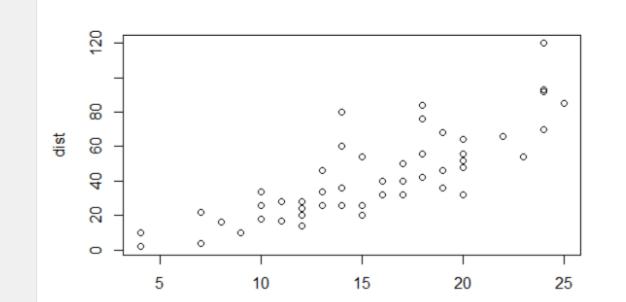

Try executing this chunk by clicking the \*Run\* button within the chunk or by placing your cursor inside it and pressing \*Ctrl+Shift+Enter\*.

Sections are marked by special quotes

––– ––– for header

```{r} ``` for R code

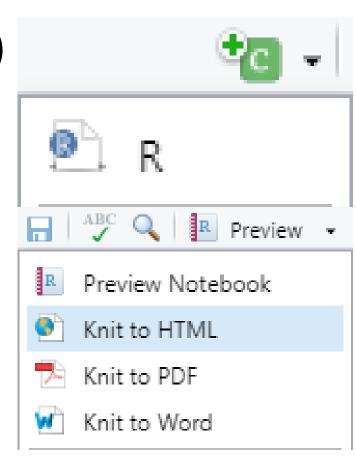

Default for unquoted text is commentary

#### Notebook workflow

- Create new notebook document
- Save it straight away (use a .Rmd extension)
- Add commentary in Markdown format
- Add R sections using Insert > R
- Run code blocks to generate output

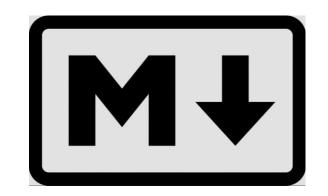

Knit document to HTML / PDF / Word

# Commentary sections use 'Markdown'

Simple markup language

Designed to be nicely readable as plain text

Compiles to properly formatted text

Simple syntax

#### Markdown basics

#### Headings

```
Heading 1
======

Heading 2
```

Lists (need a blank line first)

```
* Bullet 1

[Tab] * Sub-bullet 1

* Bullet 2
```

- 1. Numbered 1
- 2. Numbered 2

# Data Processing with Tidyverse

#### Basic Structures in R

myfunc(x, value=y)

Runs myfunc using data x and y

100 -> saveme

Saves a value under a name

myfunc(x,y) -> saveme

Saves the output of myfunc

saveme

Shows the contents of saveme

funca() %>% funcb()

Passes data from funca to funcb

#### Reading Files

Tidyverse functions for reading text files into data structures

```
read_delim("file.csv") -> data
```

read\_tsv("file.tsv") -> data

### Reading files with readr

```
> read_delim("trumpton.txt") -> trumpton
Rows: 7 Columns: 5
-- Column specification -----
Delimiter: "\t"
chr (2): LastName, FirstName
dbl (3): Age, Weight, Height
> trumpton
# A tibble: 7 x 5
 LastName FirstName Age Weight Height

#### Running R code in a notebook

### Plotting Graphs with GGPlot

Say what data you want to use

Say what graph type you want to use

Say how you want the data to affect the graph

Plot the graph

#### Geometries and Aesthetics

Geometries are types of plot

- Aesthetics are graphical parameters in a given geometry
  - Size
  - Colour
  - Fill
  - X/Y position

### Setting Aesthetics

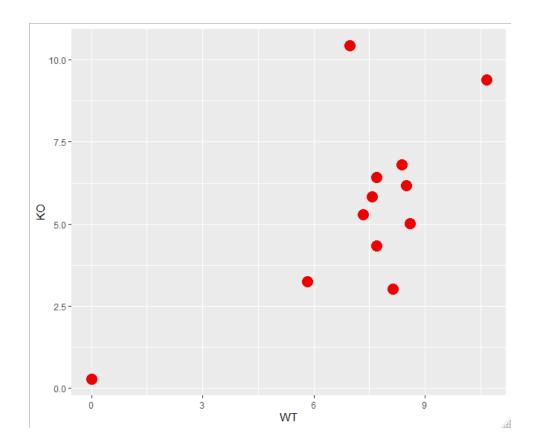

- Aesthetic Mappings
  - A column in your data defines the value for the aesthetic
    - Height is the position on the x, Weight is the position on the y
    - Colour the graph by experimental condition

- Set an aesthetic to a fixed value
  - Fill all bars with yellow
  - Make all of the points size 5

### An Example GGplot

Set the data to use

```
expression %>%
ggplot (aes(x=WT, y=KO)) + Set the aesthetic mappings
geom_point(color="red2", size=5) Set the plot type and fixed aesthetics
```

### Statistics in Tidyverse

Just more functions

```
anova_test Comparison of multiple means tukey_hsd Multiple pairwise comparisons
```

```
data %>% anova_test (x~y)
  x is a quantitative column
  y is a categorical column
Test how well we can predict x if we know y
```

# R / Tidyverse / GGPlot / Notebook Exercise

- Create a Notebook
- Write some commentary in markdown
- Load in a dataset
- Plot out the data
- Calculate some summaries
- Run some statistics

Exercise 15: Interactive Data Analysis in R

# Application Development in Python

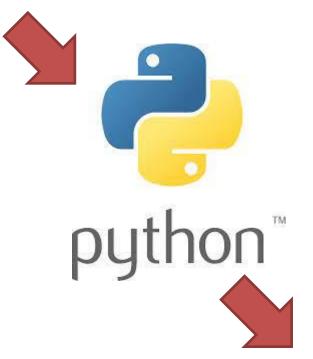

## Python is a 'scripting' language

#!/usr/bin/env python
print("I am a python program")

python
python.exe
python3
python3.exe

https://www.python.org/

C:\Introduction to Python>python example.py
I am a python program

# Different environments for writing python

```
#!/usr/bin/env python
print("I am a python program")
```

**Scripted:** code in text file, output in console

```
C:\Users\andrewss\>python
Python 3.9.1 (tags/v3.9.1:1e5d33e, Dec 7 2020,
17:08:21) [MSC v.1927 64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or
"license" for more information.
>>>
>>> print("I am an interactive session")
I am an interactive session
>>>
```

Interactive: code and output in console

```
This is a jupyter notebook it mixes code, commentary and output. It's good for analysis, but not for writing programs.

[3] ▷ ► ৣ M↓ □

print("I am a notebook")

I am a notebook
```

**Notebook:** code, commentary and output in a single file

# Python script basics

Where to find an interpreter (optional)

Series of python 'statements'.

One per line (generally). These are executed in order, from the top of the file to the bottom.

Your program finishes at the end of the file

```
#!/usr/bin/env python

my_name = "Simon"

print (my_name,"wrote his first python program")

print ("He is very proud")
```

# Thonny

- Simple python editor
- Editor at the top
- Interaction at the bottom

- Write
- Save
- Run
  - Debug!

```
Thonny - /home/student/first script.py @ 7:26
  ^ _ D X
File Edit View Run Device Tools Help
         🚺 🌣 👨 🖫 💩 🗅
   New (Ctrl+N)
 first_script.py
      #!python
      my name = "Simon"
      print(my_name,"wrote his first script")
      print("He is very proud")
 Shell
 Python 3.8.10 (/usr/bin/python3)
 >>> %Run first_script.py
   Simon wrote his first script
   He is very proud
 >>>
```

### Functions vs Methods

### Functions

 Named pieces of code. All data must be passed in to them.

```
len("Simon")
5
```

### Methods

 Functions which are associated with a piece of data. Called via the data, you don't need to pass the data in to the method

```
"Simon".upper()
'SIMON'
```

#### **Text manipulation**

string — Common string operationsre — Regular expression operations

#### **Data Types**

datetime — Basic date and time types
zoneinfo — IANA time zone support
calendar — General calendar-related functions
array — Efficient arrays of numeric values
copy — Shallow and deep copy operations
pprint — Data pretty printer
graphlib — Operate with graph-like structures

#### **Numeric and Mathematical Modules**

math — Mathematical functions
random — Generate pseudo-random numbers
statistics — Mathematical statistics functions

#### **File and Directory Access**

os.path — Common pathname manipulations stat — Interpreting stat() results tempfile — Generate temporary files and directories glob — Unix style pathname pattern expansion shutil — High-level file operations

#### **Data Persistence**

pickle — Python object serialization
sqlite3 — DB-API 2.0 interface for SQLite databases

#### **Data Compression and Archiving**

gzip — Support for gzip files
bz2 — Support for bzip2 compression
zipfile — Work with ZIP archives
csv — CSV File Reading and Writing

#### **Generic Operating System Services**

os — Miscellaneous operating system interfaces io — Core tools for working with streams time — Time access and conversions argparse — Parser for command-line options

#### **Internet Data Handling**

email — An email and MIME handling package json — JSON encoder and decoder

#### **Graphical User Interfaces with Tk**

tkinter — Python interface to Tcl/Tk

#### **Software Packaging and Distribution**

distutils — Building and installing Python modules veny — Creation of virtual environments

## Packages we're going to use

 requests - fetches data from a web resource and saves it into your program

biopython - lots of functionality related to bioinformatics.
 We're using it to parse a sequence file, but there's lots of stuff in there

# Using functions from packages

Use functions via the package

import math
math.sqrt(10)

3.162277

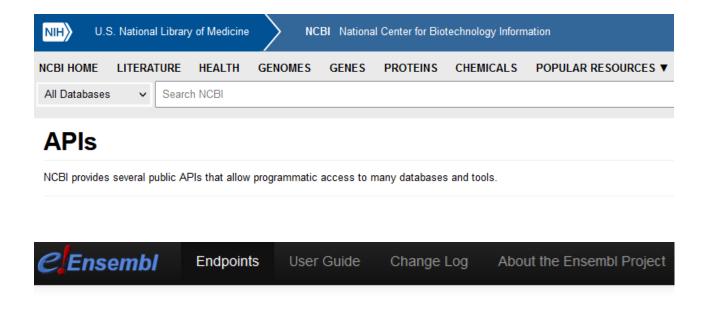

**Import individual functions** 

from math import sqrt sqrt(10)

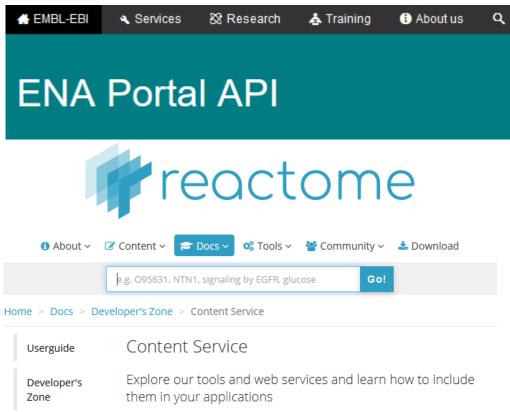

3.162277

### **APIs**

- Lots of resources make their data available programmatically
- An API describes how to query and access the data

### **Ensembl REST API Endpoints**

### Using APIs

**Endpoints** 

User Guide

Change Log

About the Ensembl Project

Contact Ensembl

Privacy Notice

### **Example Requests**

#### /xrefs/symbol/homo\_sapiens/BRCA2?content-type=application/json

Example output Perl Python2 Python3 Ruby Java R Curl Wget

```
import requests, sys

import requests, sys

server = "https://rest.ensembl.org"

ext = "/xrefs/symbol/homo_sapiens/BRCA2?"

r = requests.get(server+ext, headers={ "Content-Type" : "application/json"})

r.

if not r.ok:
    r.raise_for_status()
    sys.exit()

decoded = r.json()
    print(repr(decoded))

y
```

## Code Blocks in Python

```
animals = ["dog", cat", mouse", elephant"]
               for animal in animals:
 Block starts
               print(animal.lower())
print(animal.upper())
Block finished print("Finished listing animals")
```

4 space indent

# Exercise 16 Application Development in Python Exercise

- Ask the user for the name of a gene
- Use the Ensembl API to get the Ensembl ID for that gene
- Use the Ensembl API to get the transcript sequences
- Use BioPython to parse the sequences

Write out a list of the transcripts and their lengths
